

Appendix A - Table of Time Zone Codes

The following table lists all of the time zone codes used in the tables of climatic design conditions. The time zone codes embody the offset from UTC as well as any applicable daylight savings time scheme. Keys to the table are as follows:

- Code: 3-letter time zone acronym.
- Name: the name of the time zone, which usually explains the meaning of the acronym (e.g. AFE = Africa / East)
- Additional info: additional information, suitable for display in computer programs.
- Minutes +/- UTC: number of minutes that the time zone is ahead (positive values) or behind (negative values) Universal Time Coordinate
- DstBeg, StdBeg: start of daylight savings time and of standard time. The format is: mmdx with:
 - mm = month (01 - 12). 00 = no daylight savings time.
 - d = day of week (1 = Sunday).
 - x= which (1=1st, 2=2nd, ... 5=last).

Note that these time zone codes have no official value and are provided as an indication only. The user is invited to double-check the values provided in the tables for possible errors or changes. Note also that some time zones may appear to duplicate each other (e.g. EUC and EUN are identical) but are listed separately in the table for historical reasons.
